```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                       New vector systems comprise a sequence adapted for intracellular delivery and expression contg. a promoter operably linked to an antibody gene encoding an antibody which binds to a specific target antigen. The antibody is esp. a single chain antibody in which the heavy and light chain variable regions are joined via a hydrophilic linker peptide. Localisation seguences are pref. included in the constructs. See AAR48246-9 and AAR48252-3 for pref. (known) endoplass reticulum retention signals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Single chain antibody; sFv; heavy chain; light chain; kappa; variable domain; hydrophilic linker; antibodies;

Vignali DA;
                                                                                                               reduce transplant rejection. They may also be used f providing an exclusively T-cell-mediated response, wh class I or class-II based, or both, depending on the character of the immunogenic peptides.

(Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                       The sequences given in AAR49291-505 and AAR46981-7038 represent pept fragments of naturally-occuring immunomodulatory proteins. These fragments are between 10-30 residues in length and bind to a human major histocompatibility complex (MHC) classified allotype. These peptides may be used for therapy of autoimmune diseases, such as type I diabetes, rheumatoid arthritis and mutiple sclerosis, and to reduce transplant rejection. They may also be used for vaccination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Naturally-occuring; immunomodulatory protein; human; therapy; class I; major histocompatibility complex; class II; allotype; type I diabetes; autoimmune disease; rheumatoid arthritis; T-cell-mediated response;

                                                                                                                                                                                                                                                                                                                                         A trafficking sequence is an AA sequence which functions to control intracellular trafficking (directed movement from organelle to organelle to the cell surface) of a polypeptide to which it is attached. Such trafficking sequences might traffic the polypeptide to ER, a lysosome, or an endosome, and include signal peptides, ER retention peptides such as AAR49584; and lysosome-targeting peptides such as AAR49585 and AAR49587 and lysosome-targeting peptides such as AAR49585 and AAR49587 and lysosome-targeting peptide with such a function is the signal peptide of MHC class II alpha (AAR49587). (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          heavy chains of an antibody (Ab) fused together, and an effector molecule, where the fusion protein or Ab has the binding specificity of monoclonal Ab (MAb) B1, B3 or B5, can be used for the production of such fusion proteins or antibodies. The fusion proteins can be used in compositions as an immunotoxin to inhibit tumour cell growth. The single chain antibody can be used to detect the presence or absence of cells bearing a Lewis(Y) carbohydrate antigen in a patient. The antibodies are also useful as multiple targetting moieties, providing at least 2 kinds of biological activity. They can also be used in diagnostic assays and for the imaging of tumours when attached to a radiolabel and for the pathological diagnostic functions.
                                                                                                                                                                                                                                                                                                                                                                                          various amino acid deletions in domains II and III, single amino acid substitutions and addition of one or more sequences at the C-terminal end. The wild type C-terminal sequence of the Pseudomonas exotoxin is given in AAR95221.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           tumours. Humanised antibodies are less immunogenic than the mouse MAbs B1, B3 and B5, making them more suitable for long term treatment. The effector molecule used is preferably a drug or cytotoxin which then produces an immunotoxin capable of selectively killing particular cells. Preferred toxins are the Pseudomonas exotoxin or Diphtheria toxin. These are both highly toxic compounds and so are modified to eliminate domain Ia of the Pseudomonas toxin,
                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Single chain fusion proteins and antibodies - useful to diagnose treat cancer, specifically bind Lewis(Y) related carbohydrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Benhar I,

The vaccine is administered by the oral consumption of the plant and provides the first known functional method for immunising animals using transgenic plants, where the plants express bacterial antigens that act as both immunogens and adjuvants. The method provides an inexpensive production and delivery system for such antigens to animals. This sequence acts as a microsomal retention signal and was used to modify the LT-B Escherichia coli toxin subunit C-terminal sequence. The sequence coding for the whole LT-B gene was used in the construction of such a transgenic plant. The immunogenic agent preferably comprises the LT-B or CT-B (cholera toxin B subunit) or

This sequence represents a endoplasmic reticulum retention peptide, and can be used in the method of the invention. The method is for producing an RNA-loaded antigen presenting cell (APC) that presents on its surface a tumour or pathogen antigenic epitope (TAE or PAE respectively) that induces T cell proliferation and an immune response against the tumour or
                                                                                                                                                                                                                                                                                                                                                                                                 RNA-loaded antigen presenting cell; trafficking sequence; APC production; tumour formation; pathogen infection; antigenic epitope; immune response; T cell proliferation; cytotoxic T lymphocyte; adoptive immunotherapy; therapy; TAE; CTL; PAE; endoplasmic reticulum retention peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Endoplasmic reticulum retention signals include a mammalian signal (AAR95063), a bacterial signal (AAR95064) from Pseudomonas exotoxin, and a yeast signal (AAR95065). The signal may form part of a multidomain protein (see also AAR95053-58) that is used with an effector nucleic acid for the transfer of nucleic acids to targeted cells as a means of gene therapy. The endoplasmic reticulum retention signal functions to affect intracellular routing of the internalized protein/nucleic acid complex.
                                                                                                                             Use of RNA-loaded antigen presenting cells - to induce T-cell proliferation for the treatment or prevention of tumour forma

AAW21967-W21969 represent linkers used in the immunotoxins of the invention. The immunotoxins bind to target cells, and comprise, a Besudomonas exotoxin (PB) that does not need proteolytic activation for cytotoxic activity fused to a VH framework region of an Fv antibody (Ab) fragment. The VH chain region is bound through at least one disulphide bond to a variable light (VL) chain framework region. The PE is lacking residues 1-279 and is at least 10-fold more cytotoxic to the target cells than an immunotoxin comprising PE attached to a VH chain framework region of an Fv Ab fragment lacking a disulphide bond to a VL chain framework region. These sequences are used to join the VH chain region the PE. The immunotoxins can be used for killing target cells in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PCR; primer; amplify; polymerase chain reaction; antibody; immunotoxin; variable heavy chain; VH; murine monoclonal antibody; Lewisy; carcinoma; carbohydrate antigen; Pseudomonas exotoxin; proteolytic activation; cytotoxic activity; tumour; autoimmune condition; rheumatoid arthritis; graft versus host disease; organ transplant rejection; type I diabetes; multiple sclerosis; systemic lupus erythematosus; myasthenia gravis; multiple sclerosis; systemic lupus erythematosus; myasthenia gravis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        pathogen, and comprises introducing into an APC in vitro, RNA that encodes the antigen. The RNA-loaded APCs can be used to stimulate cytotoxic T lymphocyte (CTL) proliferation ex vivo or in vivo. The ex vivo expanded CTL can be administered to a patient in a method of adoptive immunotherapy. The methods can be used for treating or preventing tumour formation or pathogen infection caused by e.g. HIV, hepatitis, influenza, poliomyelitis, measles, herpes, mumps or rubella viruses, Salmonella, Shigella or Enterobacter. The method circumvents tneed to purify RNA or isolate and identify a TAE or PAE.
                                                                                                                                                                                                                                                                          Immuno:toxin(s) comprising Pseudomonas exotoxin linked to di:sulphide stabilised variable heavy and light chain regions of antibody - useful for killing target cells bearing characteristic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   17-APR-1997

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         treatment of tumours, autoimmune conditions, graft versus host disease, organ transplant rejection, type I diabetes, multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus, myasthenia gravis, etc, all caused by T and B cells. They can also be used to deliver an antibody to the cytosol of a cell, and in vitro in the elimination of harmful cells from bone marrow before transplant. The immunotoxins have high cytotoxicity to target cells and a small size to provide greater penetration to target cells.
                                                                       in the intracellular transport and cytotoxicity of ETA. This suggests that ETA interacts with the KDEL receptor and that ETA may reach the interior of the EF before penetrating the cytosol. The invention provides a means of delivering compounds to cells as conjugates with modified ETA. The modified ETA is able to cross
                                                                                                                                                 for returning back to the endoplasmic reticulum (ER) proteins that have escaped the ER and entered to Golgi complex. The mechanism involves the KDEL receptor. The KDEL motif can replace a REDL motif (see AAW76395) present at the C-terminal end of Pseudomonas aeruginosa exotoxin A (ETA, see AAW76391). This motif is important
                                                                                                                                                                                                                                                                                               Delivering compounds to cells as new conjugate with detoxified exotoxin A - able to cross membranes and deliver to the cytople.g. nucleic acids, antibodies, tumour suppressors etc.
                           chain antibodies and tumour suppressors.
                                          membranes and deliver e.g. therapeutic agents to such as nucleic acids, peptides, peptide nucleic
                                                                                                                                                                                                                                   This peptide is the consensus intracellular transport signal used

This construct is used in a method to target imaging agents to epithelial surfaces at which they may remain or undergo transepithelial transport via transcytosis. At least one imaging agent is linked to the targeting molecule comprising a polypeptide that (a) forms a closed covalent loop, (b) contains at least 3, preferably 4, peptide domains having beta-sheet character separated by domains lacking beta-sheet character and (c) is not full length dimeric IgA. The imaging agents are useful in the diagnosis of disease. The target molecule is also capable of specifically binding to a basolateral factor associated with an epithelial surface to cause internalisation of a biological agent linked to the target molecule.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The endomembrane retention signal is used in the synthesis of a targeting molecule (TM). The TMs are used to target biological agents to epithelial surfaces at which they can be internalised. The TMs comprise a polypeptide that: (a) forms a closed covalent loop; (b) contains at least 3, preferably 4, peptide domains having beta-sheet character separated by domains lacking beta-sheet character; and (c) is not full length dimeric IgA. The TMs are useful to prevent and/or treat diseases associated with epithelial surfaces, e.g. asthma, cancer, (myco) bacterial, viral or fungal infection, inflammatory disorders, autoimmune disorders, celiac disease, colitis, pneumonia and cystic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         J chain; targeting molecule; epithelial; beta-sheet; asthma; cancer; inflammatory disorder; autoimmune disorder; celiac disease; colitis; pneumonia; cystic fibrosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This peptide, when joined to the C-terminus of a protein, acts as an endoplasmic reticulum (ER) recycling signal that localises the protein from the Golgi body back to the ER when expressed in a C cell. A claimed novel plasmid comprises a sequence, linked to that includes, or is linked to, an intracellular target protein C that includes, or is linked to, an intracellular targeting sequence (ITS) such as this peptide. Other ITS peptides (see AAW56512 and C AAW56514) are provided that direct localisation in the lysosome or C the ER. The novel plasmid is used as a protective or the ER. The novel plasmid is used as a protective or therapeutic DNA vaccine to immunise against the immunogenic target protein (claimed), particularly in cases of allergy, cancer (or other proliferative diseases such as gooriasis), microbial cinfection or autoimmune disease, e.g. rheumatoid arthritis, C infection or autoimmune disease, e.g. rheumatoid arthritis, C pernicious anaemia and many others. A particular use is against C pathogens that, at least for part of their life cycle, are c intracellular, e.g. hepartitis C, HIV, Neisseria gonorrhoeae, the process of the ER.

CC Listeria and Shigella. The cyctotxic T cell response is enhanced contacts.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           chelating moiety selective for a monovalent or divalent metal ion (to act as a fluorescent indicator for the metal ion) and (b) at least one targeting peptide (to localise the compound to the inside of a cellular organelle). Preferably the polysaccharide is dextran, ficol, heparin, glycogen, amylopectin, mannan, inulin, starch, agarose or cellulose with a molecular weight less than 3,000,000. The metal ion is preferably Na+, K+, Li+, Ca2+ or Mg2+. The compounds are useful for analysing intracellular ion levels, especially Ca2+. The present sequence represents a carboxyl terminal sequence commonly shared by localisation peptides
                                                                                                                                                                                                                                                                                                               Endoplasmic reticulum; carboxy terminus; Golgi apparatus; glycosyltransferase; membrane anchor; oligosaccharide syn
                                                                                                                                                                                                                                                                                                                                                      C-terminal sequence of endoplasmic reticulum retained proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bifunctional chelating polysaccharides used for analysing intracellular ion levels - have chelating moieties attached which act as a fluorescent indicator in the presence of selected metal

Expression cassette for producing glycosyltransferase in secretable form - lacking membrane anchor and Golgi retention signal, used for synthesis of oligosaccharide(s)

```
XX

XX

The invention relates to expression cassettes which contain a promoter CC and a DNA sequence encoding a secreted glycosyltransferase that lacks CC the membrane anchor and the Golgi retention signal. The glycosylcransferases are used in enzymatic oligosaccharide synthesis.

CC They are produced in a soluble form that is secreted into the culture medium without loss of enzymatic activity, resulting in increased compoduction and simpler recovery (free of any membrane-bound glycosylcransferase), compared with extraction from mammalian tissue. The present sequence represents a carrboxy-terminal sequence sufficient for XX

Patent NO. US2001003042A1
GENERAL INFORMATION:
APPLICANT: Lorens, James
TITLE OF INVENTION: Multiparameter FACS Assays to Detect Alterations in TITLE OF INVENTION: Cell Cycle Regulation
FILE REFERENCE: A66587/DDB/RMS
CURRENT FILING DATE: 1980-09-21
NUMBER OF SEQ ID NOS: 46
SOFTWARE: Patentin Ver. 2.0
                                                                                                                                        Sequence 23, Application US/09759960 Patent No. US20010006639A1

No. is the number of results predicted by chance to have a
ore greater than or equal to the score of the result being printed,
I is derived by analysis of the total score distribution.
